FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

Topics of Presentation

1. Ageing in Europe and Germany
2. Digital Data Sources for Accessibility Analysis
3. Access to Health Care for Senior Citizens in a Rural Area
4. Access to Health Care for Senior Citizens in an Urban Area
5. Conclusions

Analysis of Accessibility in this Study

- Rural Area:
Access: Transportation by car
Limiting Constraints: Distance and resulting travel time
- Urban Area:
Access: Walking
Limiting Constraints: reduced walking mobility as well as barriers on 'walking ways'

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

Digital Data Sources

Location of Medical Practices

- Data Sources: Health Insurance Association, Phonebook, Websites

Road Network

- Data Source: OpenStreetMap, value „maxspeed“

Footpath Network

- DataSource: Digitized on aerial photos (WMS from local government)

Barriers on Footpath

- Data Source: Collection with Mobile Mapping App

FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

Examples for Barriers

- Signs in wrong height
- Physical barriers, like trash bins
- Stairs
- Narrow footpaths
- Uneven ground, like sand, gravel
- Roots of large trees

FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

How to Measure Spatial Accessibility? (I)

Step 1: Calculation of catchment areas for all medical practices

Definition of three corridors $c(5)$, $c(10)$, $c(15)$, with travel time t

$t(5) = 5 \text{ minutes}$

$t(10) = 10 \text{ minutes}$

$t(15) = 15 \text{ minutes}$

FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

How to Measure Spatial Accessibility? (II)

Step 2: Intersection of road segments and corridors

$c(5)$, $c(10)$, $c(15)$ corridors \rightarrow spatial intersection for all medical practices $m \rightarrow 3 \times m$ attributes for all road segments (rural area) and footpath segments (urban), respectively. Attribute value indicates if a segment takes part in a $c(5)$, $c(10)$, $c(15)$ corridor of a medical practice m .

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

How to Measure Spatial Accessibility? (III)

Step 3: Including attractivity of primary care practices.

Linear decrease of attractivity with increasing distance from the physician's practice → attaching different weights p to the the catchment corridors $c(5)$, $c(10)$, $c(15)$

$$p(5) = 3$$

$$p(10) = 2$$

$$p(15) = 1$$

FIG WORKING WEEK 2017

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

How to Measure Spatial Accessibility? (IV)

Step 4: Quantification of local accessibility to primary health care by score values

Summing up the weights $p(i)$ of all catchment areas, in which a certain road segment (rural) or footpath segment (urban) takes part in \rightarrow score value $S(k)$ of the road segment (rural) or footpath segment (urban) k .

Example If a segment takes part in 2 $c(5)$ corridors, in 3 $c(10)$ corridors and in 4 $c(15)$ corridors, for instance, then its score value amounts to $S(k) = 2 \times 3 + 3 \times 2 + 4 \times 1 = 16$.

From digitalisation to augmented reality

How to Measure Spatial Accessibility? (V)

Step 5 (optional): Integrating barriers in the calculation of catchment areas

If the study area is not too large, collected barriers can be used for the calculation of the catchment areas. These catchment areas can be used for accessibility analysis for mobility reduced people.

Ex.: Score value in the rural town Hillesheim for the street segment marked in red

*Persons residing along the street segment marked in red can reach
8 medical practices within 5 min by car,
2 medical practices in between 5 and 10 min,
9 medical practices in between 10 and 15 min,
 $S = 8*3+2*2+9*1 = 37$*

Surveying the world of tomorrow -

Helsinki Finland 29 May - 2 June 2017

From digitalisation to augmented reality

Conclusions

- Identified accessibility problems to primary health care for elderly people in both rural and urban areas
- Primary health care to be reachable and accessible for the broad population → potential accessibility problems to be addressed by health care planning
- Methods in use working on administrative district level thus not reaching a small-area level
- Proposed new method reveals distribution of accessibility to primary care on street segment level both for rural and urban areas
- Spatially accurate identification of areas that need special attention with regard to accessibility of primary health care
- Data collection and quality tests still necessary
